

Guardrail Systems

Our parapet guardrail is a lightweight edge protection system which uses a bracket to secure the handrail over the parapet. This system is for use in situations where there is a parapet wall in place but the height of that wall is less than the minimum height recommended by current health and safety legislation to be used as fall protection.

The bracket is fully adjustable to allow installation over copings of various widths and angles. The parapet system shares many components with the freestanding and topfix systems which allows all three systems to be installed together on the same project.

The top riser is fully adjustable allowing the height of the horizontal rails to be adjusted. Our parapet system is ideal for use in situations where access is required close to the edge of the roof.

The system is supplied in kit form using modular components. The number of components is kept to a minimum making ordering and specification quick and simple. The parapet system is quick and easy to install and can be added to, reconfigured or adapted just as quickly. Our range of high quality galvanised fittings mean there's no need to bend or weld saving you time and money on site.

SIMPLE

Utilises the minimum numbers of components and requires no special tools for installation.

DURABLE

Galvanised anti-corrosion coating equivalent to BS EN ISO1461 with zinc coated steel grub screws.

VERSATILE

Prefabricated components allow quick and easy erection and adaption.

The parapet system is only for use on good quality coping stones which are capable of withstanding the additional loading exerted by the system
