

Guardrail Systems

Our range of lightweight edge protection systems are ideal for situations where collective fall protection measures are required, for instance where flat roofs contain equipment which requires regular repair or maintenance. The risk of falling from the roof edge is greatly reduced by the means of our guardrail protection systems.

The system is supplied in kit form and uses a minimum number of components to make ordering, specification and erection as quick and simple as possible.

Our systems modular design means there's no bending or welding needed, saving installers valuable time on site. All our systems are manufactured from high quality steel with a galvanised anti corrosion coating giving a durable maintenance free finish and can be installed on new buildings or retro-fitted onto existing flat roof areas.

There are three systems that make up the range, each system is specifically designed to be installed on different roof types, all three systems share key components which mean they can be configured together on the same roof area offering the greatest flexibility for most roof configurations.

Free Standing system

This system uses a proven counter balanced weight system and is installed completely free standing without the need to drill into or secure to the roof membrane.

Parapet system

Our parapet system is designed for use where access is needed right up to the roof edge. The parapet assembly is fully adjustable for use where coping stones are used to cap the wall top.

Top Fix system

The Top fix system secures directly to a wall or coping top. This system can also be used to permanently protect edges to stairwells, open shafts or loading bays.
